THIS PAGE IS BLANK

PART I: GENERAL INFORMATION

The basic function of the model FD4 Fire Pump Controller for diesel engine driven fire pumps is to automatically start the engine upon a drop in pressure in the water main, or from a number of other demand signals. This controller provides automatic cycled cranking, alarm and/or alarm shutdown protection for various engine failures. Stopping of the engine after the demand period is over may be either manual or automatic. This controller also includes an automatic weekly test starting feature.

PART II: FUNCTIONS

Equipment is provided in the Controller to provide the following functions:

- A. Automatic Starting From:
 - a. Drop in water line pressure
 - b. Loss of battery charger output (if enabled)
 - c. Operation of optional remote start switches, such as remote start switch, deluge valve switch, fire alarm switch, etc.
 - d. Weekly test timer
- B. OID Operator Interface Device Provided for display of alarm functions, system pressure, battery volts, battery charger amps, alarm conditions, etc. Includes a 4 line by 20 character LCD for display of system messages and programming.
- C. Auto-Off-Manual selector switch.
- D. Automatic Cranking A microprocessor controlled crank cycle timer provides six (6) fixed crank periods separated by five (5) rest periods each of approximately 15 seconds duration.
- E. Alarms and Signal Lights Fourteen (14) Standard lights are provided to give visual signals for; "System Fault", "Battery #1 Healthy", Battery #2 Healthy", "Charger #1 Failure", Charger #2 Failure", "AC Power Loss", "Engine Running", "Engine Failed to Start", "Engine Low Oil Pressure", "Engine High Water Temp", "Engine Overspeed", "Low Fuel", "Pump On Demand", "Contactor Coil Failure", "ECM Alternate", and "ECM Failure". In addition the mode buttons have LED's on the button indicating "Auto", Manual", "Test", or "Off" mode. 8 additional lights, configurable by the factory, can be provided for "Pump Room Alarms". An audible alarm horn is mounted on the front of the cubicle for sounding in the event of failure. Terminals are provided for remote failure indication of the following:
 - "Automatic Mode" "System Fault" "Engine Running (2 sets)" "Common Battery Fault"
- F. A data logger is provided as standard to record system pressure along with numerous alarm conditions and system events. The data can be displayed on the OID or can be downloaded to a PC through the RS485 port provided on the main system board. Data is stored on an SD Memory card. This card contains individual pressure files with each file containing one days worth of pressure data. Each file is of the PressXXX.txt format. Each entry is stamped with the date and time and system pressure at that time. The Events.txt file contains all of the logged events with each event stamped with date and time. The SD memory card can be removed and files transferred directly to a PC using appropriate memory card reader. The controller will continue to operate normally with the SD card removed. There will, however, be a visual and audible alarm when the card is removed. Events and pressure data will continue to be logged while the card is missing. The memory cards should be replaced within 12 hours to ensure that no data is lost.
- G. A weekly test timer is supplied to automatically start the engine any set day of the week, at a set time of day, and a preset run time. See Part IV below for more information and the System Config Screen 106.
- H. "**Stop**" Pushbutton A pushbutton is provided to stop the engine in Auto at any time provided all starting demands have cleared. This returns the controller to the automatic position. The Auto-Off-Manual selector switch can also be put in the "Off" mode to stop the engine. Any starting commands will not start the engine in the "Off" mode.
- I. Integral Battery Chargers (Option J). There are two separate fully automatic, solid state chargers provided for maintaining full charge on the dual sets of engine batteries. An LED display is provided on each charger to indicate charger AC input voltage is present and DC output voltage is present.

User Preferences Screen 218 and 219 are used to determine when the Charger Failure alarm will activate. When Screen 218 is set to No, the Charger Failure alarm will not be active while the engine is running. Should both chargers fail or switch off due to a high voltage output from the engine alternator, the AC Power Failure lamp may come on. This is normal. It will reset

automatically once the engine stops running and the charger failure alarms reset. When Screen 218 is set to Yes, the Charger Failure alarm will be active at all times when the Mode selector switch is in the Auto or Manual mode. Screen 219 is used to determine the time delay between the failure contacts on the charger closing and the Charger Failure lamp and audible alarm sounding on the controller.

J. Cabinet - A heavy gauge steel cubicle encloses the controller. The OID, the key operated Auto-Off-Manual (AOM) Selector Switch and manual start pushbuttons are mounted on the outer door. The battery circuit breakers are located inside the cabinet on the main back panel of the unit. A key for the AOM switch is stored in a break-glass housing on the door of the cabinet. An additional key is located inside the cabinet.

PART III: OPERATION OF THE CONTROLLER

A. When the controller is the "**Auto**" mode and both circuit breakers are in the "**On**" position, the controller is in standby condition ready to start the engine automatically. A green pilot light above the "**Auto**" button will illuminate in this mode. Also, Battery #1 Fault and Battery #2 Fault lights should be off indicating that battery power is available.

When the water pressure drops below a level which is set in System Config Screen 101, the Controller will actuate the starter motor and the cranking cycle will commence. In addition the **"Pump on Demand"** light will illuminate. If the engine starts and runs, cranking will cease and the protective circuits will be operative. If the engine fails to start after six (6) crank periods, cranking will cease, the **"Engine Failed to Start"** light will illuminate, and the alarm horn will sound. The fuel solenoid will stay on for one hour however. This is to allow the engine to continue to run in the event the failed to start condition was due to a faulty speed switch signal from the engine. The battery alternating circuit alternates batteries on each crank attempt unless one battery is in a discharged state and incapable of cranking the engine. In this instance, the control will lock onto the other battery for the remaining cranking attempts. Dry contacts for remote indication of **"Battery Failure"** are provided.

The panel is wired so that optional remote start switches may be used, such as Deluge Valve, Remote Start pushbutton, External Pressure, These start switches will also cause the **"Pump on Demand"** light to illuminate.etc. In addition, when "Power Failure Engine Startup" feature is enabled (System Config Screen 111), the Controller will automatically start the engine upon loss of Battery Charger output or AC Power loss, after an adjustable time delay (System Config Screen 112).

While the engine is running, all protective circuits are operative. If the engine stops while running, and there is still an auto start demand, the control will attempt to restart the engine. If the engine fails to start the **"Engine Failed to Start"** light will illuminate and the alarm will sound. If, while the engine is operating, the oil pressure drops below a safe limit, the **"Low Oil Pressure"** light will illuminate immediately. After approximately seven (7) seconds the alarm will sound. Should the engine temperature exceed a safe limit while running, the **"Engine High Water Temp."** light will illuminate after a seven (7) second time delay and the alarm will sound indicating engine overheating.

In case of Overspeed, the engine will be stopped and the **"Engine Overspeed"** light will illuminate and the alarm will sound. The light and alarm will stay on until the Engine Speed Switch and the Controller are manually reset. To manually reset the Controller, turn the controller selector switch to **Off**, then press the Reset button. Then turn the selector switch back to **"Auto"**.

The Controller may be configured as either "**Manual**" or "**Automatic**" stop as required (System Config Screen 104). "**Manual**" stop is set as standard. The current status of this setting is visible on the Main System Status Screen where the letter "A" will appear in the upper right hand corner of the screen when set to Automatic Stop and an "M" will appear when set for Manual stop. When Automatic stop is enabled the stop timer is preset at the factory to 30 minutes. Longer time settings can be set in System Config screen 105 with a maximum setting of 60 minutes possible. When "Automatic Stop" is disabled, the engine will continue to run even though the pressure switch or other remote starting switch returns to its normal position. The engine can be stopped immediately only by pressing the stop button or by turning the Auto-Off-Manual switch to the **Off** position. On engines that do not use the "energize to stop" method (i.e. Caterpillar), the engine may also be stopped by turning the circuit breakers BATT1 and BATT2 to OFF. If set up for "**Automatic**" stop, the engine will be stopped automatically upon restoration to normal of whatever demand switch started the engine providing it has run at least 30 minutes or longer as set in System Config screen 105. If the demand period was less than the time set on the auto stop timer, the engine will continue to run until the timer times out and then will stop.

- B. When the "**Test**" mode button is pressed for two or more seconds, the engine will be started by causing a drop in water pressure. Failure alarm circuits will be operative in the "**Test**" mode. This method of starting provides a test of the Controller, thereby assuring proper operation when required. The engine will run for the time set in Auto Weekly Test Length Of Run Time (System Config Screen 109) or until the "**Stop**" push button is pressed or the selector switch is turned to "**OFF**".
- C. The **''Manual''** position of the Auto-Off-Manual switch is for manually starting the engine from either battery. The fuel and water solenoids are energized in this position, and the engine must be cranked by pushing one of the buttons located below the

OID. "Manual Crank 1" cranks from Battery 1, and "Manual Crank 2" cranks from Battery 2. Pressing both buttons will result in cranking from both batteries simultaneously.

- D. When the engine is given a command to stop for any reason, terminal 12 will energize and will remain on for approximately 15 seconds. The controller will not start until terminal 12 is de-energized again.
- E. Periodic Self Testing The Test Run Timer can be set to give test runs on any day of the week and time of day desired. A timing element is incorporated in the control so that when the engine starts in this manner, it will run for a definite time before it shuts down. See System Config Screens 106 through 109 to set the starting time and length of engine running.
- F. Provision for sequential starting is accomplished by the use of adjustable time delay on pressure drop starting or "Deluge Valve" starting. On Multiple Pump installations these timers are set sequentially and progressively longer in time to prevent more than one (1) pump from starting simultaneously with another pump. Failure of the lead pump to start will not prevent subsequent pumps from starting. The time delay on starting is set in System Config Screen 103.
- G. The "Pump On Demand" alarm light is provided to indicate that there is a command to start and run the additive pump controller. This includes a low pressure condition, deluge valve start signal etc. The alarm light will clear when the start condition has been cleared such as the water pressure in the system rises above the high set point set in screen 102.
- H. The "Contactor Coil Failure" alarm light is to annunciate a loss of continuity to the two engine starting contactors on the engine. There is a low level DC current that is applied to field terminals #9 and #10 to detect continuity in the contactor coils. Should the contactor coil open or fail, the "Contactor Coil Failure" LED will illuminate and the alarm horn will sound. In addition there will be an entry in the Event log to indicate which Contactor coil has failed.
- I. The "Loss of DC Power" lamp is provided to indicate that both batteries have been disconnected or turned off but AC power is still available. The alarm horn will also sound upon the loss of DC Power and can not be silenced.
- J. The "ECM Alternate" and "ECM Failure" alarms apply only to those engines that have electronic fuel control. Should the "Electronic Control Module" Fail the "ECM Failure LED will illuminate and sound the horn. In addition if the Alternate Electronic Control Module is switch over to control the engine, the "ECM Alternate" LED will illuminate and sound the horn.

PART IV: INSTALLATION AND TEST PROCEDURE

A. INSTALLATION

The Fire Pump Controller has been assembled and wired at the factory in accordance with the highest workmanship standards. All circuits and functions have been thoroughly tested to assure correct operation when properly installed. The installer should be completely familiar with the external hookup of the engine junction box to the terminal bar in the Controller. Various engine components must be wired to the proper terminal in the controller using the correct size of stranded wire. An appropriate size wire must be wired from the grounding lug in the controller to earth ground. In most cases, the engine manufacturer furnishes the engines with all accessories installed and wired to the connection box. Therefore, it is only necessary to wire from the engine connection box to like numbered terminals in the Controller. Note proper wire sizes. All wires must be stranded.

A drain valve is provided to relieve water pressure to the pressure switch, thus closing the pressure switch contacts and starting the engine. This test simulates an actual start demand. Since the Controller operates the drain valve only momentarily, a small amount of water is drained off. The water pressure sensing line to the Controller from the pump must be thoroughly flushed before connection to the Controller in order to remove chips, particles, or other matter, that could enter the plumbing components in the Controller.

Controllers configured with "Automatic Stop" enabled may be changed to "Manual" stop by disabling this feature in System Config Screen 104. If deluge valve switches are to be used for starting, enable the Deluge Valve Option in Config Screen 121 and connect the remote normally closed switch to terminals 31 and 111.

B. TEST PROCEDURE

All of the following tests should be made on each unit after installation. If each test is satisfactory, the operator may place the control switch in "Auto" mode and depend upon the panel operating properly when required. Also, any one or all of these tests may be carried out at any time after installation, if so desired. NOTE: If 115 Volts A.C. is not connected to Controller, the "Charger Failure" lights and "AC Power Loss" light and alarm will be activated and if the Power Failure Start feature (System Config Screen 111) is enabled, the controller will start automatically. The 115VAC must be turned ON to prevent the engine from starting.

ENGINE TERMINAL (terminals 1-12) STATUS INDICATOR LIGHTS

Light Emitting Diodes (L.E.D.) lights have been installed on the microprocessor module to indicate the status of each engine terminal. Status indication is given below:

<u>Terminal Number</u> (Microprocessor Func #)	L.E.D. (light) "ON" Indication
1 (Out 06)	Power available to fuel and water solenoids
2 (In 06)	Speed switch has operated into engine running mode
3 (In 07)	Speed switch has operated into overspeed mode
4 (In 08)	Oil Pressure switch contacts closed (Low Oil Pressure)
5 (In 09)	Water temperature switch contacts closed (High Engine Temp.)
6 (In 01)	Battery #1 voltage present
8 (In 02)	Battery #2 voltage present
9 (Out 02)	Crank #1 voltage present (while cranking on Battery #1)
10 (Out 03)	Crank #2 voltage present (while cranking on Battery #2)
12 (Out 07)	Energize to stop voltage present

a. BATTERY LOCKOUT TEST:

- 1. Turn on Battery #1 switch and Battery #2 switch.
- 2. Press the "Reset" button. Battery #1 and Battery #2 Healthy lights should be on.
- 3. Turn Battery #1 switch off for a couple of seconds and back on. Battery #1 light should go off and remain off.
- 4. Press "**Reset**" button. Battery #1 light should come on.
- 5. Repeat for Battery #2.
- b. CRANKING CYCLE TEST: This test simulates a condition where the engine refuses to start.
 - 1. Disconnect Terminal No.1 on Controller panel. **NOTE: Disconnecting Terminal No.1 is for the purpose of** removing power from the fuel solenoid so engine will not start. On engines where the fuel solenoid is not used (Caterpillar), or is connected other than through Terminal #1 (Clarke-G.M.), other means must be used to stop fuel flow to the engine to prevent starting.
 - 2. Press the "Test" mode button to start cranking the engine. Time the crank and rest periods, and count the number of cranks. There should be six (6) crank periods separated by five (5) rest periods each of approximately 15-seconds duration. The "Failed to Start" light should come on and the alarm horn should sound. Status indicator light for Terminal #1 should come on as soon as the "Test" push button is pressed and the pressure drops below the low set point. Indicator lights for terminals 9 and 10 should come on alternately to indicate cranking cycle. (See above)
 - 3. Press the "Stop" push button to stop the engine and properly reconnect all leads.

NOTE: In order to prevent discharging the starting batteries, this same test can be made without actually cranking the engine by disconnecting the starter cable and observing the action of the starter contactors and/or status indicator lights for terminals 9 and 10.

c. CHECKING STARTING MOTOR RELEASE

- 1. Press the "**Test**" mode button. Engine should start promptly and starting motor should release at approximately 1/3 of engine speed. Status indicator light for terminal #2 should come on to indicate speed switch has operated to disconnect cranking and the Engine Running LED should illuminate.
 - NOTE: A convenient method of determining the exact instant the starter releases is to connect a battery test light or voltmeter across the starter terminals and observe when power is disconnected.
- 2. Press the "Stop" push button to stop the engine.

d. OIL PRESSURE FAILURE TEST:

1. Press the **"Test"** mode button to start engine. When the engine is starting and oil pressure is not yet up to full pressure, the **"Engine Low Oil Pressure"** light will illuminate, but the horn will not sound. When pressure builds up, and the

switch opens, the light will go out. This feature provides indication that the oil pressure switch contacts are operating in a normal manner.

Note: On Electronic Engines with electronic oil pressure sensors, the oil pressure light may not illuminate while the engine is cranking. The low oil pressure test should be performed on these engines with the engine running as described below.

- 2. After the engine is running, connect a temporary jumper between terminal #4 and terminal #11.
- 3. Both the **''Engine Low Oil Pressure''** light and status indicator light for terminal #4 should come on immediately. Wait approximately seven (7) seconds. Alarm horn should sound.
- 4. Press the "Stop" push button to stop the engine and remove jumper between terminal #4 and terminal #11.
- 5. Wait at least 30 seconds for elements to reset before making any further tests.

e. WATER TEMPERATURE FAILURE TEST:

- 1. Press the "Test" push button to start engine.
- 2. Jumper contacts on water temperature switch on engine.
- 3. Alarm horn sounds and the **"High Water Temperature"** light on controller will illuminate after approximately 7 seconds. Status indicator light for terminal #5 should come on with **"High Water Temperature"** light.
- 4. Press the "Stop" push button to stop the engine and remove jumper on water switch.

f. OVERSPEED FAILURE TEST:

- 1. Press the "Test" mode button to start engine.
- 2. Momentarily short the contacts on the engine speed switch, or connect a temporary jumper between terminal #3 and #6 on the controller.
- 3. The alarm horn sounds and the **"Engine Overspeed"** light will illuminate immediately. Engine comes to a stop. Status indicator lights for terminals #3 and #12 should come on with the **"Engine Overspeed"** light.
- 4. Remove the jumper from terminals #3 and #6 then turn the selector switch to the **Off** position. Press the **"Reset"** button to reset the **"Overspeed"** alarm. Turn the selector switch back to the **Auto** position.

g. CONTACTOR COIL FAILURE ALARM TEST:

 While the controller is in the "Auto" mode disconnect the field wire from terminal 9. Within a few seconds the "Contactor Coil Failure" lamp should illuminate and the alarm horn should sound. Reconnect the field wire to terminal 9. The "Contactor Coil Failure" lamp should go out and the alarm horn should silence. Repeat for terminal 10.

h. AUTOMATIC STARTING TESTS:

- 1. Place control in "Auto" position.
- 2. Bleed off pressure in system until pressure drops below the low set point. The **"Pump on Demand"** light should come on.
- 3. Engine should start automatically and continue to run after pressure rises above the high set point, if arranged for "Manual" stop. If arranged for "Automatic" stop, engine will continue to run for time set on Engine Run Timer and then stop.
- 4. Press the "**Stop**" push button to stop the engine.
- 5. Repeat tests for each demand switch such as deluge valve, remote start, etc.

i. PERIODIC WEEKLY START TEST:

- 1. Pressure must be up and all other demand switches de-activated.
- 2. 115 V.A.C. power must be turned on to the panel.
- 3. When the current day and time of day matches the settings in System Config screens 107 and 108, the solenoid drain valve will energize and the engine will begin cranking. It will continue to run for the amount of time set.

- 4. Should a remote manual start occur or a low pressure condition occur while the pump is running on Weekly Test, the pump will not stop until the Stop pushbutton is pressed or if set for Automatic Stop, the Minimum run timer times out.
- 5. The periodic Weekly Test function is factory set to No in Screen 106 due to Factory Mutual standard requirements. Contact the Metron Factory Service department for instructions to turn this function on if this is not a Factory Mutual insured facility.
- j. SETTING PROGRAM WEEKLY TEST TIME: System Config screen 106 through 109.
- k. REMOTE START SWITCH CIRCUITS: Field wiring terminals are provided on the controller so that optional remote start switches such as Remote Pushbutton Stations, Deluge Valve Switch, Fire Alarm Switches, etc., may be used to start the engine. Two (2) sets of terminals are provided. Terminals #112 and #31 are used for remote manual start push buttons (close to start). Terminals #111 and #31 are used for remote Deluge Valve Switch or other remote automatic start switches (open to start). Upon automatic start from this type of switch, the engine will be stopped either automatically (if set for automatic stop) after the demand switch de-activates and Engine Auto Stop Timer times out, or manually at the Controller. Terminals #111 and #31 must have a jumper installed if a remote Deluge switch is "Enabled" but not to be used. When the controller is shipped from the factory Deluge Valve start is Disabled (System Config screen 121).
- AC POWER FAILURE STARTING: If this feature has been enabled it can be tested by disconnecting the normal 115 V.A.C. to the Controller. After the preset time delay (which is specified in System Config screen 112), the Controller will commence cranking the engine. The "Charger #1 Failure", "Charger #2 Failure", and "AC Power Loss" lamps will illuminate and the alarm will sound without delay.
- m. NORMAL OPERATION AUTOMATIC: Turn the selector switch to the "Auto" position. A green "Automatic Mode" light will illuminate and the engine will automatically start upon drop in pressure or operation of other start switches. If the Auto Stop Timer is disabled (Manual Stop) the engine must be turned off at the Controller. When the Auto Stop Timer is enabled, upon termination of the demand signal, the engine will run for the length of time left on the Auto Stop Timer and then will stop automatically.
- n. AN ADJUSTABLE SEQUENTIAL START TIMER IS SUPPLIED FOR MULTIPLE PUMP INSTALLATION: Normally, the leading pump Controller will not have a delay timer and will commence cranking the engine immediately upon operation of a demand signal (other than Power Failure which is time delayed). The subsequent Controllers will have a time delay which is adjustable from 0 to 999 seconds. Each time delay should be set with progressively longer times on each subsequent pump. The recommended time interval is ten (10) to fifteen (15) seconds. This may be extended or shortened as required by the local authorities having jurisdiction.
- o. PUMP ROOM ALARMS: Field terminals may be provided for various inputs from pump room alarms. These alarms include: Low Fuel, Low Pump Room Temperature, Reservoir Low, Reservoir Empty, Low Suction Pressure, Relief Valve Discharge and/or Flow Meter On etc. A maximum of ten (8) pump room alarms are available. The Controller is arranged so that the alarm horn will sound and the light will come on when the alarm sensor contacts close. These pump room alarms can be silenced with the "Silence" push button on the OID if they have been configured as silenceable.
- p. FOAM PUMP OPTION: An optional feature to operate an external pressure dump valve can be provided for Foam Pump Service if required. Screen 318 is set to approximately 10-15 seconds to operate a dry contact which can be used to operate the Dump Valve solenoid. This contact will close when a demand for the pump to run is received such as low pressure, deluge valve, remote start, weekly test start etc. Once the engine is running, the timing circuit will start and keep the contact close for the length of time set in screen 318. Then it will open and de-energize the dump valve allowing the pump to develop full pressure. In addition, if the controller is not activated by a pressure start, the pressure transducer can be deactivated through screen 319. This will also remove the pressure display from the main status screen of the OID. The controller can only then be activated by a remote start such as deluge valve or remote start contacts. This a factory settable option only and must be ordered with the controller before it ships from the factory.

PART V: ADDITIONAL OPTIONAL FEATURES

A. **Battery Charger Operation:** The Battery Chargers are mounted in the engine controller, and are factory wired to the controller terminal block from which it obtains its 120 volt, 50-60 Hz. supply voltage, and through which it provides charging current to the batteries. The charging current to the two (2) batteries and the battery voltage is monitored by the controller and displayed on the OID. The charger output is current limited and provides full protection during the engine cranking cycle. The charger input and output are fused for protection in case of a failure of the control circuit or other internal component.

Each battery charger is fully automatic, and will charge the batteries at a rate of up to 10 amperes. As the batteries approach full charge, the current will taper off to a predetermined level at which time the charger automatically switches to the float mode of operation. In the float mode the charger maintains the batteries at the float potential (approximately 12.7 volts for a 12-volt battery or 25.4 volts for the 24-volt battery).

The charger provides a means of monitoring the charger output to sound an alarm in case of loss of charger output. This also provides a means of monitoring the A.C. power since a loss of A.C. power results in a loss of charger output.

Never disconnect the batteries from the controller while the AC power is on to the controller as this may cause damage to the printed circuit boards.

In the event that a battery is lost or disconnected the output of the charger will stop (0 volts). This will allow the voltage sensing circuit of the fire pump controller microprocessor to detect a missing battery or open circuit from the battery. This will result in the respective Battery Fault light to illuminate and the alarm horn to sound. Before reconnecting the battery to the controller, turn the AC power off. Then reconnect the battery to the controller and turn the AC power back on to reset the alarm.

Generally, when all conditions are normal, the batteries will come to a full charge prior to the 24 hour period. As batteries begin to charge, the controller OID will indicate a gradual decrease in current flow. When these ammeters indicate a current level of less than 0.5 amps the charger will be in a trickle mode.

Check batteries daily for a few days after initial installation has been made, and weekly thereafter. Batteries should be checked for overcharging (gassing), or undercharging (low voltage, or low specific gravity of the electrolyte or acid.

CAUTION: Under no circumstances should new electrolyte (acid) be added to a battery that has been previously filled. Only distilled water is recommended for maintenance purposes.

PART VI: OPERATOR INTERFACE DEVICE (OID) USE AND NAVIGATION

The Operator Interface Device (OID) provides visual indication of the alarms, status of system parameters, and an interface to change set points to configure the FD4 to operate appropriately for various installation requirements.

Common Tasks Performed Using The OID

Silencing Horn: If a horn is sounding and the alarm is silence able, a quick press of the [SILENCE/LAMP TEST] will silence the horn (less than 1 second press).

Resetting Alarms: If the alarm condition has cleared, press and hold the [RESET/ESC] button 2 to 5 seconds to reset alarms. "Engine Failed to Start" and "Engine Overspeed" alarms require the system to be in the OFF mode before a reset is allowed.

Test Mode: When controller is in Auto Mode, pressing and holding the [TEST] button for two or more seconds will open the pressure drain solenoid thus dropping the pressure which causes the controller to start the engine. Pressing and releasing the [TEST] button in Manual Mode will illuminate the lamp on the button but has no effect on the starting.

Lamp Test: To illuminate and check all the OID LED's and the horn, press and hold the [SILENCE/LAMP TEST] button 5 or more seconds or until all the lights turn on.

Sample display only. For general reference only.

The [SYSTEM STATUS], [SYSTEM LOGS], and [CONFIG] buttons navigate the user to the top screen of a column of similarly grouped screens or menus.

- **<u>SYSTEM STATUS</u>**: The [SYSTEM STATUS] button can be pressed at any time to return the screen to the home System Status screen #1. System Status screens display the real time information variables about the pump system.
- **SYSTEM LOGS:** The [SYSTEM LOGS] button displays the System Logs menu. Once the menu is displayed, buttons with numbers on them can be used to enter the selected data log. See the following page for details on navigating the System Logs.
- **<u>CONFIGURATION</u>**: The [CONFIG] button displays the Config menu which groups the different types of set points that configure the system to operate in the desired manner. Use the [UP] and [DOWN] buttons to scroll between the two menu screens. Buttons with numbers on them can be used to enter the selected configuration screen group. See the Configuring the FD4 section for descriptions on the functionality of each set point.

<u>SYSTEM LOGS</u>: The FD4 has three separate data logs; 1) alarm log, 2) event log, and 3) pressure log. The alarm log is a subset of the event log and only displays the last ten alarms that have occurred or cleared. The event log records all alarm and system function type events

1	SYSTEM LOGS
SYSTEM	1) Event Log
LOGS	2) Pressure Log
	2, 11055410 20g

SYSTEM LOGS: The [UP] and [DOWN] arrow buttons can be used to scroll through the three data logs. The [CHANGE/ENTER] button enters and exits the alarm/event details in either the Alarm or Event logs. In the Pressure Log the [CHANGE/ENTER] button changes the skip rate used to scroll through the logged pressure readings.

Printing System Log Data: The following applies if a PC is connected to the RS485 com ports using a null modem cable. When the [PRINT] button is pressed when looking at data in one of the three logs, a menu for what is to be printed is displayed. Pressing [1] prints just the alarm/event/pressure reading currently being displayed. Pressing [2] prints a range of data before and after the currently displayed alarm/event/pressure reading currently displayed. The range can be changed in the User Preferences setpoints 210 and 211. If you use the RS485 port to download the data, use Microsoft windows Hyperlink program and configure for Baud Rate as 9600, Data bits as 8, Parity as None, Stop Bits as 1 and Flow Control as None. When the print button on the OID is pressed, data will be sent to the PC via the port you have connected to.

CONFIGURATION SCREENS: All parameters that control the operation of the controller can be viewed and changed within the Configuration set point screens. Each set point is protected by a user password to prevent unauthorized changes. The system set points are separated into five different group

s.		
² CONFIG	 CONFIG SYSTEM SETPOINTS USER PREFERENCES TECH SCREENS 	 SYSTEM SETPOINTS (Level 1 password): These setpoints adjust the conditions for starting and stopping the engine. USER PREFERENCES (Level 1 password): These setpoints adjust settings not related to engine operation.
	2 CONFIG 1) ANALOG SIGNALS 2) AUXILLIARY ALARMS	 3) TECH SCREENS (Level 2 password): These setpoints are for factory/technician purposes only and are used to fine tune special systems. 1) ANALOG SIGNALS (Level 2 password): These setpoints calibrate the analog pressure and battery volt readings.
		2) AUXILLIARY ALARMS (Level 2 password): These 12 user programs are used to setup any auxiliary signals that need to be monitored.

Changing Values:

- 1) Navigate to the configuration set point screen that contains the value that needs to be changed.
- 2) Press [CHANGE/ENTER]. If a password has not been entered for a while, the "ENTER PASSWORD" screen will be displayed. Use the [1] [2] and [3] buttons to enter the appropriate password.
- 3) Once the correct password level has been attained, the "CHANGE VALUE" screen for the value to be changed will be displayed. An underscore cursor will appear beneath the first digit on the entry.

Use [UP] or [DOWN] arrow buttons to scroll the value of the digit with the cursor. Press [CHANGE/ENTER] to accept each digit's entry. The cursor will move to the right so the next digit can be changed. Pressing [SILENCE/RESET/ESC] or the [SYSTEM STATUS] button will exit change mode without changing the original value.

Example of how to change a setpoint value:

101 SYSTEM SETPOINTS Engine Start	CHANGE/ ENTER	ENTER PASSWORD:	101 CHANGE VALUE Engine start
Pressure		****	Pressure
[100.0]psi 0-999.9			[60] psi 0-999
		Press the [1], [2], or [3] keys to	Prose the [UD] and [DOWN]

screen 214.

enter the password. The default

user password is 1111. This

can be changed by the user in

Press the [UP] and [DOWN] arrow keys to change each digit at the cursor, press [CHANGE/ENTER] to accept the digit and move the cursor to the right. Press [SILENCE/RESET/ESC] to escape the change value screen and to keep the original value. **Printing Configuration Setpoints:** The following applies if a PC is connected to the RS485 com port using a null modem cable. When the [PRINT] button is pressed while looking at a configuration setpoint screen, a menu for what is to be printed is displayed. Pressing [1] prints just the set point screen currently being displayed. Pressing [2] prints all the set points in the section of set points currently displayed. Pressing [3] prints all the set point screens of all five set point sections.

NOTE: when printing all set points, only Aux#01 User Programs 501 through 515 will be printed. To print any of the remaining eleven aux alarm settings, press [PRINT] when inside the appropriate Aux alarm and select [2] for "2) PRINT 500 SETPTS." The 501 through 515 Aux User Programs for that aux alarm will be printed.

PART VII: SYSTEM SET POINT DEFINITIONS

Note: Sample settings shown below. Not to be used to program controller for operation. Consult factory for correct settings for the site conditions.

settings for the site conditions.	
Configure System Setpoints	
101 SYSTEM SETPOINTS	If system pressure is at or below this setting the engine will start if the system is in Auto mode. The Start pressure should never he set higher than the stop pressure
Pressure	There should be about a 5 psi difference between the start and stop pressure.
[60] psi 0-999	settings.
102 SYSTEM SETPOINTS	If system pressure is at or above this setting and the engine is running in Auto
Engine Stop	mode, the engine can be stopped using the stop pushbutton or can automatically
Pressure	stop if auto stop is enabled in setting 104.
[90] psi 0-999	
103 SYSTEM SETPOINTS	This time setting delays the start of the engine in Auto mode when a low pressure
Engine Start Delay	condition or deluge valve start signal is received. This setting is normally used for
[10] seconds 1-999	multiple pump installations where sequencing of pump starting is desired.
104 SYSTEM SETPOINTS	When enabled, the engine will stop automatically after all starting demands have
Engine Automatic	been satisfied. The timer set in 105 below must also time out before the engine
Stop Enabled	will stop. Factory default is NO.
105 SYSTEM SETPOINTS	The minimum run time that the engine must run before stopping automatically.
Engine Minimum	Must be set to at least 30 minutes per NFPA 20. Only active if 104 above is set to
[30]minutes 30-60	Enabled.
106 SYSTEM SETPOINTS	When set to "Yes" and the controller is in Auto mode, the controller will start the
Automatic Weekly	engine and run for a preset time and then automatically stop. The day of the week
Engine Test Run	and time the engine would start once a week are set in set points 107 and 108 below. Pequires the Tech password to change. Contact Matron Factory
[105]	below. Requires the reen password to change. Contact metron ractory.
107 SYSTEM SETPOINTS	The day of the week that the automatic weekly test start will begin.
Auto Weekly Engine	
Test Day OI The Week	
[100]	
108 SYSTEM SETPOINTS	The time of day the automatic weekly test start will begin.
Auto Weekly Engine	
Test Start Time	
[10:00:00]	
109 SYSTEM SETPOINTS	The length of time the engine will run when started on automatic weekly test.
Auto Weekly Test	Must be set for a minimum of 30 minutes per NFPA 20.
Length Of Run Time	
110 SYSTEM SETPOINTS	When this feature is enabled, the engine will stop on Low Oil pressure or High
Auto Weekly Test	Engine Water Temperature during the weekly test run. If some other auto start
Oil/Water Shutdown	demand occurs, the controller will restart the engine.
[169]	
111 SYSTEM SETPOINTS	When this feature is enabled the engine will start if the AC power to the controller
Power Failure Engine	fails. The time delay set in 112 below is used to override momentary outages.
Startup	
[169]	

<pre>112 SYSTEM SETPOINTS Power Failure Engine Start Delay Time [1] minutes 0-500</pre>	When set point 111 above is enabled, set this timer for the length of time desired to sense a loss of AC power and override any momentary outages.
113 SYSTEM SETPOINTS Pressure Transducer Failure Engine Start [Yes]	When this feature is enabled, the controller will start the engine if a faulty pressure transducer is detected, i.e. loss of output from the transducer or max voltage sensed from the transducer indicating it has shorted.
114 SYSTEM SETPOINTS Not Used	Setting Reserved For Factory Configurations
115 SYSTEM SETPOINTS Not Used	Setting Reserved For Factory Configurations
116 SYSTEM SETPOINTS Shutdown On Low Intake Pressure/Lvl [No]	Low Suction Shutdown – If this feature is enabled and a separate suction pressure switch is connected to the controller, the engine will not start or it will stop if already running, if there is a low suction pressure condition.
117 SYSTEM SETPOINTS Shutdown On Low Intake Trip Time [0]seconds 0-999	Set this timer for the desired time to override momentary dips in suction pressure before a shutdown will occur.
118 SYSTEM SETPOINTS Low Intake Shutdown Auto Reset [No]	If enabled, once the low intake pressure condition has cleared and remained clear for the set point 119 reset amount of time, the low intake alarm will clear itself.
119 SYSTEM SETPOINTS Low Intake Shutdown Auto Reset Time [0]seconds 0-999	Amount of time that low intake pressure condition needs to be clear before an automatic reset of a low intake alarm can occur if enabled in set point 118.
120 SYSTEM SETPOINTS Pressure Switch Engine Start [No]	If enabled this setting activates the logic to monitor an optional pressure switch dry contact closure (ie normally open contact that closes to start engine) that will start the engine on a low pressure condition if system is in Auto mode.
121 SYSTEM SETPOINTS Deluge Valve Engine Start [No]	If enabled this setting activates the logic to monitor an optional deluge valve dry contact opening (ie normally closed contact that opens to start engine) that will start the engine if system is in Auto mode.
122 SYSTEM SETPOINTS High System Pressure Alarm [100.0]psi 0-999.9	This setting determines the pressure at which the High System Pressure variable will be turned on. This is used primarily for variable speed engine applications. It can be used to illuminate a lamp and activate remote dry contacts.

123 SYSTEM SETPOINTS Engine Lockout Latched [No] This setting determines if only a momentary input to the Engine Lockout input is required to stop the engine after an automatic stop, or prevent it starting automatically. Can only be activated at the factory by Metron.

Configure User Preferences 201 USER PREFERENCES Set the current FD4 clock (24 hour clock). Set System Real Time Clock [17:03:52]202 USER PREFERENCES Set the current FD4 date. Set System Date [12/31/99] 203 USER PREFERENCES Set the local day of the week. Set System Day Of The Week [Monday] 204 USER PREFERENCES When this feature is enabled, the controller will log the current system pressure in Log System Pressure the event log when system pressure has dropped below the set pressure value. Drop Events Typically set to "No" as not to needlessly fill up the event log. [No] 205 USER PREFERENCES The desired pressure that will cause a log of system pressure in addition to the Low Pressure Event normal periodic logging of system pressure. Trip Pressure 0.0]psi 0-999 206 USER PREFERENCES The amount of time the pressure must be above the pressure setting in screen 205 Low Pressure Event before the Pressure Drop Event is logged as being cleared. Reset Time 5] seconds Γ 0 - 2.0207 USER PREFERENCES The frequency at which system pressure is automatically logged. Normally set to Time Between 15 seconds. Lower values will increase the number of logged pressures and fill up Pressure Log Samples the memory in a shorter period of time. [15] seconds 15-999 208 USER PREFERENCES When set to Yes, each pressure log entry will be printed as it occurs. This should Auto Print Each be set to No to save printer paper and wear on the printer. Pressure Log Sample [No] 209 USER PREFERENCES When set to Yes, each event log entry will be printed as it occurs. This should be Auto Print Each set to No to save printer paper and wear on the printer. Event Log Entry [No] 210 USER PREFERENCES This setting will determine the start point of print range of the pressure, alarm, or Selective Range event log based on which log entry is currently being viewed. Printing [1] Before 1-99 211 USER PREFERENCES This setting will determine the stop point of print range of the pressure, alarm, or Selective Range event log based on which log entry is currently being viewed. Printing 1-99 [1] After

Configure User Preferences 212 USER PREFERENCES LCD Back Light Mode 0=Always on [0]] 1=Power Save	(continued) Set to Always on or to Power Save if it is desired to have the backlight automatically shut off when no buttons have been pressed for a preset period of time. This should only be done if battery power is limited and AC power is not on.
213 USER PREFERENCES Language Select 0=English 1=Spanish [English]	Set to English or Spanish
214 USER PREFERENCES Change User Password Level 1 [****]	Used to set the password necessary to access the System config screens.
215 USER PREFERENCES Save All Settings to SD card [No]	Used to save auxiliary alarm configuration parameters to the SD card
216 USER PREFERENCES Load All Settings from SD card [No]	Used to load auxiliary alarm configuration parameters from the SD card
217 USER PREFERENCES Pressure Units [psi]	Used to select between psi, bar and kg/cm2 as the display of pressure
218 USER PREFERENCES Engine running chrg failure alarm [No]	Used to select whether the charger failure alarm will be active while the engine is running or not.
219 USER PREFERENCES Charger failure delay time [5]sec 0-999	Used to select the time delay before the controller will signal an alarm on the charger failure after the contacts close on the battery charger.
220 USER PREFERENCES Modbus Address	Sets the Modbus Address when turned on via screen 221
221 USER PREFERENCES Modbus Enabled (Disables Printer) [No]	Turns on the Modbus protocol via the RS485 and turns off the ASCII text output for the printer.
222 USER PREFERENCES Modbus/Printer Baud [9600]	Baud Rate for the Modbus or Printer, depending on which is selected in screen 221
223 USER PREFERENCES Modbus Parity	Parity setting for the Modbus, either Even or Odd
[None]	

PART VIII: ALARM AND EVENT LOG MESSAGES

The following lists all the possible messages that can be recorded within either the alarm or event logs.

Batterv1 Low Voltage	Batterv1 voltage is/was less than the Battery Low Voltage trip voltage set in set
Dacceryr How Vorcage	Le la servicie de la
Alarm Occurred/	point #306
Alarm Cleared	
Atarili Cicarca	
Batteryl Disconnectd	Batteryl wiring has been disconnected and/or BAT1 switch is in the OFF position
Alarm Occurred/	
Alarm Cleared	
Batterv1 Switch off	Batteryl wiring has been disconnected and/or BAT1 switch is in the OFF position
Dacceryr Bwreen orr	Datter i witting had been arbeenneeted and of birt bwitten ib in the off position
Alarm Occurred/	
Alarm Cleared	
Battery2 Low Voltage	Battery2 voltage is/was less than the Battery Low Voltage trip voltage set in set
Alarm Occurred/	point #306
Alexand Classed	
Alarin Cleared	
Batterv2 Disconnectd	Battery2 wiring has been disconnected and/or BAT2 switch is in the OFF position
Alarm Oggurrod (
Alalin Occurreu/	
Alarm Cleared	
Battery? Switch off	Battery2 wiring has been disconnected and/or RAT2 switch is in the OFF position
Batteryz Switten OII	Batteryz witting has been disconnected and/or BATZ switch is in the off position
Alarm Occurred/	
Alarm Cleared	
Charger I Fault	Charger I fault contacts are/were in a fault state. Causes could be disconnected
Alarm Occurred/	battery, wrong battery voltage. AC power loss. etc.
Alarm Glossed	· · · · · · · · · · · · · · · · · · ·
Alarm Cleared	
Charger 2 Fault	Charger 2 fault contacts are/were in a fault state. Causes could be disconnected
Alarm Occurred/	battery wrong battery voltage AC power logg etg
ATATIN OCCULLEU/	bactery, wrong bactery vortage, At power ross, etc.
Alarm Cleared	
AC Power Failure	AC Power Failure declared when both battery chargers are in a fault condition at
AC LOWCE PATTURE	in the second of the second when been bactery chargers are in a fault collution at
Alarm Occurred/	the same time.
Alarm Cleared	
Tanin - Original I	
Engine Overspeed	An overspeed signal was detected coming from the engine. FD4 controller must be
Alarm Occurred/	put in OFF mode to reset this alarm.
Alarm Closned	
Alarin Cleared	
Engine Failed to	FD4 controller attempted to start engine in Auto mode but the engine failed to
Start Marm Occurred	start (is a orgina run signal was never respired) FD4 controller must be put in
Start Alarm Occurred	statt (le a engline fun signal was never received). FD4 controller must be put in
Start Alarm Cleared	OFF mode to reset this alarm.
Engine Quit	FDA controller lost the engine run signal from the engine while it was running in
Eligine Quit	The concrotter tost the engine fun signal from the engine while it was funning in
Alarm Occurred/	Auto mode. This could be a bad wire connection or a problem on the engine that
Alarm Cleared	shut the engine down other than an overspeed or failed to start condition.
LOW ()11 Pressure	A low oil pressure signal was received from the engine while the engine was

Low Pressure Start Occurred Cleared	A low pressure start was attempted because of a low pressure reading from the transducer or optional pressure switch while in Auto mode.
Low Press Condition Occurred Cleared	System pressure dropped below the start pressure or the optional pressure switch indicates a low pressure condition. This can be logged in all modes of operation.
Deluge Start Occurred Cleared	A deluge start signal was received while in Auto mode.
Controller Reboot Occurred	DC power was restored to the FD4 microprocessor.
Pressure Drop Occurred Cleared	If setpoint #204 is set to yes, this event gets recorded when the system pressure drops below the setting in setpoint #205.
Low Intake Pressure Shutdown Occurred Shutdown Cleared	If the low intake shutdown option is enabled in setpoint #116, a low suction signal will stop the engine.
Auxiliary Alarm Occurred Cleared	Indicates one of the aux alarms occurred as programmed in the user programs and was set to record in the event or alarm log but the text message assigned was 0. See Aux Alarm Text List Messages below for possible auxiliary alarm messages.

Aux Alarm Text List Messages		List of possible internal variables used as inputs for aux alarm user programs.	
0 Auxiliary Alarm		1 0	
1 High Fuel Level	30	Low Oil Pressure	
2 Fuel Spill	31	General Battery Fault	
3 Fuel Tank Rupture	32	Engine Quit Alarm	
4 Low Pump Room Temp	33	Pressure Transducer Fault	
5 Reservoir Low	34	Low Intake Shutdown Alarm	
6 Reservoir Empty	35	Pump On Demand, Fire Condition	
7 Reservoir High	36	System Fault	
8 Flow Meter On	37	Auto Mode	
9 Relief Valve Open	38	Manual Mode	
10 Low Suction Pressure	39	Off Mode	
11 High Engine Oil Temp	40	Overspeed	
12 Low Jacket Water Flw	41	Failed to Start	
13 Low Jacket Water Lvl	42	High Water Temp	
14 Low Hydraulic Press	43	AC Power Failure	
15 Low Firewater Press	44	Batt 1 Failure	
16 Air Damper Closed	45	Batt 2 Failure	
17 Air Damper Open	46	Charger 1 Failure	
18 Alternator Fault	47	Charger 2 Failure	
19 Low Gear Oil Press	48	General Charger Failure	
20 Low Coolant Level	49	Low Fuel Level	
21 High Gear Oil Temp	50	Pressure Drop Event	
22 Start Motor Fault	51	High System Pressure	
23 Low Fuel Pressure	52	Low Pressure	
24 Pump On Demand	53	Engine Auto Available	
25 High Exhaust Temp	54	Contactor Coil Failure	
26 High Fuel Temp	55	Test Mode	
27 Pump Room Ajar	56	Hi Zone/Low Zone Mode	
28 ECM Alternate	57	Contactor Coil 1 Failure	
29 ECM Failure	58	Contactor Coil 2 Failure	
30 High System Pressure	59	Engine running	
31 Dump Valve	60	Weekly Test Due	
32 User Alarm Text	61	Dump Valve	
	62	Engine Lockout Latched	

SD CARD FILE FORMAT.

The controller is equipped with an SD (Secure Digital) memory card on the motherboard to store the Pressure log, Event log, Operators Manual in PDF format, Auxiliary Alarm configuration information and the controller drawings in PDF format. The SD card is located on the right hand edge of the motherboard and is removed by pressing in on the right edge of the card to release from the card holder. When the SD card is removed, data is still being recorded on temporary flash memory on the motherboard. Once the card is replaced, the stored data will be written back to the SD Card. When the SD card is removed, the LCD display will indicate that the card is missing and that is should be replaced. If the card is not replaced within approximately 1 minute, the alarm will sound and the System Fault LED will come on. Once the SD card is replaced, the System Fault LED will go out but the Alarm Silence button must be pressed to silence the alarm horn. The data stored on the SD card is in standard ASCII text format and can be read by an computer equipped with an appropriate SD card reader. These are readily available at any electronics store. The data on the SD card is in the following format:

PressXXX.txt file

Data is stored in a standard comma delimited file as follows: 07/27/07, 11:07:52, 060

Date Time Pressure

Each file starting with "Press" contains one days worth of pressure data.

Events.txt file

Data is stored in a standard comma delimited file as follows: ,Battery2 Low Voltage, Alarm Cleared 07/27/07 ,11:09:26 ,060 cont..... Date Time Event Action Pressure 0. 0. 1. 0, 1, 1, 1. cont..... Auto mode, Engine running, Charger 1 Fault, Charger 2 fault, Battery 1 OK, Battery 2 OK, ACPwerFail cont.....

1, 000 LowFuelLvl Event Txt

Appendix A

RS485 Port Usage For Serial Modbus RTU protocol:

The Modbus option on the fire pump controller boards can be enabled by disabling the printer option to the onboard RS485 port. All communications to this port will be in a 2 wire RS485 format. 255 controllers can communicate on a single network. The pinout cabling required for connection to the port is as follows. It is necessary to apply a terminating resistor to both ends of the network. Note-Only 50 Modbus registers can be polled at time from the controller. I/O servers must be set up accordingly.

Modbus Setup From Controller Interface:

From the 200 series user preference configuration screens the Modbus setting can be access from screens 220 through 223. Screen 220 is used to set the Modbus address 1-255. All Modbus devices on a network must have a unique address.

Screen 221 is used to enable/disable the Modbus option. If 'Yes' is selected the Modbus will be enabled and the RS485 port can no longer be used as a printer port.

Screen 222 is used to set the baud rate for the RS485 port. The baud rates possible are 2400, 4800, 9600, 19200, and 38400 bits/second. Note that the baud rate setting is for the RS485 port in general and applies for Modbus and printer usage.

Screen 223 is used to set the Modbus parity. Valid selections are 'Even', 'Odd', and 'None'. This setting must match the parity setting of all other Modbus devices on the network.

Modbus Register Usage Description:

The historical event and pressure logs, and real time clock can be accessed and controlled through the Modbus registers listed below.

Register 40001 is a write to controller only register where commands can be entered to accomplish the following as seen in figure 1.1. Depending on the Modbus I/O server used, either the individual bits in register 40001 can be toggled or integer values can be written. Either way, the controller automatically zeros register 40001 after a valid command is received.

Description	Modbus Registers	Usage Notes For Read/Write Registers
Set Real Time Clock	040001:0	Bit 0 Of Modbus Register 040001 - Must Write a 1 Into Register 040001 To Set Clock
Remote Start Diesel Engine	040001:1	Bit 1 Of Modbus Register 040001 - Must Write a 2 Into Register 040001 To Start Engine
	040001:2	
Increment Event Historical Log Data	040001:3	Bit 3 Of Modbus Register 040001 - Must Write an 8 Into Register 040001 To Increment Event Historical Log Pointer
Decrement Event Historical Log Data	040001:4	Bit 4 Of Modbus Register 040001 - Must Write a 16 Into Register 040001 To Decrement Event Historical Log Pointer
Increment PSI Historical Log Data	040001:5	Bit 5 Of Modbus Register 040001 - Must Write a 32 Into Register 040001 To Increment PSI Historical Log Pointer
Decrement PSI Historical Log Data	040001:6	Bit 6 Of Modbus Register 040001 - Must Write a 64 Into Register 040001 To Decrement PSI Historical Log Pointer
Set Historical Event Log To Most Current Record	040001:7	Bit 7 Of Modbus Register 040001 - Must Write a 128 Into Register 040001 To Set Event Historical Log To Most Current Record
Set Historical PSI Log To Most Current Record	040001:8	Bit 8 Of Modbus Register 040001 - Must Write a 256 Into Register 040001 To Set PSI Historical Log To Most Current Record

Real Time Event Monitoring:

All events listed below in figure 1.2 are real time and can be viewed in Modbus register 40002. Figure 1.2 depicts the 16 bit breakdown and cross reference. This is not to be confused with the historical event log.

Description	<u>Medbus Registers</u>	Usage Notes For Read Only Registers
Bit 0 'Switch In Auto'	040002:0	Bit 0 Of Modbus Register 040002 - Indicates the 'Switch In Auto' Event
Bit 1'System Fault'	040002:1	Bit 1 Of Modbus Register 040002 - Indicates The 'System Fault' Event
Bit 2 'Engine Running'	040002:2	Bit 2 Of Modbus Register 040002 - Indicates The 'Engine Running' Event
Bit 3 'Battery Fault'	040002:3	Bit 3 Of Modbus Register 040002 - Indicates The 'Batter Fault' Event
Bit 4 'Charger Failure'	040002:4	Bit 4 Of Modbus Register 040002 - Indicates The "Charger Failure' Event
Bit 5 'Failed To Start'	040002:5	Bit 5 Of Modbus Register 040002 - Indicates The 'Failed To Start' Event
Bit 6 'AC Power Failure'	040002:6	Bit 6 Of Modbus Register 040002 - Indicates The 'AC Power Failure' Event

Setting And Reading The Real Time Clock Through Modbus:

Modbus registers 40007 through 400013 are real time clock read registers as seen in figure 1.3. To set the clock current values must be entered into registers 40014 through 40020. Any of these registers left to zero will result in an incorrect clock setting. Once desired clock date and time values are entered bit 0 of register 40001 must be toggled for the controller to accept the values. This can be done by setting bit 0 high or writing a 1 to register 40001. The controller will then accept the new values.

Description	Medbus Registers	Usage Notes For Read Only Registers
Real Time Clock Month	040007	PLC Read Real Time Clock Month 1-12
Real Time Clock Day	040008	PLC Read Real Time Clock Day 1-31
Real Time Clock Year	040009	PLC Read Real Time Clock Year 00-99
Real Time Clock Hour	040010	PLC Read Real Time Clock Hour 1-24
Real Time Clock Minute	040011	PLC Read Real Time Clock Minute 0-59

Real Time Clock Set Second	040019	PLC Set Real Time Clock Second 0-59
Real Time Clock Set Day Of Week	040020	PLC Set Real Time Clock Day Df Week 0-6 "Sunday = 0"

Figure 1.3

Most Current And Historical Alarms and Events:

The most recent event or alarm date time stamped can be viewed from Modbus registers 40021 through 40027. Register 40021 contains a number representing the most current alarm or event and if it is an occurring or clearing event. The meaning of this number can be cross referenced from figures 1.6 through 1.9. Date and time for the event or alarm are viewed in registers 40022 through 40027. See figure 1.4 for register interpretation.

Description	Modbus Registers	Usage Notes For Read Only Registers
Most Current Event Number	040021	Most Current Event That Happened 1-175 (Index Below)
Most Current Event Month	040022	Most Current Event Month 1-12
Most Current Event Day	040023	Most Current Event Day 1-31
Most Current Event Year	040024	Most Current Event Year 00-99
Most Current Event Hours	040025	Most Current Event Hours 1-24
Most Current Event Minutes	040026	Most Current Event Minutes 0-59
Most Current Event Seconds	040027	Most Current Event Seconds 0-59

Figure 1.4

The historical events and alarms can be viewed from Modbus registers 40028 through 40035. Here it is possible to scroll through the entire log and set the log pointer to the most current record. Register 40028 contains a number representing the actual log number entry location in the controller. Register 40029 contains a number representing the event or alarm that can be indexed using figures 1.6 through 1.9. Registers 40030 through 40035 show the date and time stamp information for the log record being pointed to.

To maneuver through the log:

Toggling bit 3 or writing an 8 to register 40001 will increment the log by one entry.

Toggling bit 4 or writing a 16 to register 40001 will decrement the log by one entry.

Toggling bit 7 or writing a 128 to register 40001 will set the log to view the most current log entry.

It is recommended to set the log to the most current entry before scrolling. Upon doing this the historical log should show the same data from registers in Figure 1.4. When scrolling, it is possible to move forward and backward through roughly a full weeks worth of data.

Most Current And Historical Pressure Readings:

The most recent system pressure with date time stamp can be viewed from Modbus registers 40036 through 40042. Register 40036 contains a number representing the most current pressure read by the controller. The value is scaled and should match the pressure displayed on the main status screen on the controller OID. Date and time stamp for the pressure reading is viewed in registers 40037 through 40042. See figure 1.10 for register interpretation. The pressure log must be set up to log on an interval for these pressure readings to be logged.

Description	Modbus Registers	Usage Notes For Read Only Registers
Most Current PSI Pressure	040036	Most Current PSI 0-300 PSI (Real Time Value)
Most Current PSI Month	040037	Most Current PSI Month 1-12
Most Current PSI Day	040038	Most Current PSI Day 1-31
Most Current PSI Year	040039	Most Current PSI Year 00-99
Most Current PSI Hours	040040	Most Current PSI Hours 1-24
Most Current PSI Minutes	040041	Most Current PSI Minutes 0-59
Most Current PSI Seconds	040042	Most Current PSI Seconds 0-59

The historical pressure readings can be viewed from Modbus registers 40043 through 40050. Here it is possible to scroll through the entire log and set the log pointer to the most current record. Register 40043 contains a number representing the actual log number entry location in the controller. Register 40044 contains a number representing the logged pressure reading. Registers 40045 through 40050 show the date and time stamp information for the log record being pointed to.

To maneuver through the log:

Toggling bit 5 or writing a 32 to register 40001 will increment the log by one entry.

Toggling bit 6 or writing a 64 to register 40001 will decrement the log by one entry. Toggling bit 8 or writing a 256 to register 40001 will set the log to view the most current log entry.

It is recommended to set the log to the most current entry before scrolling. Upon doing this the historical log should show the same data from registers in Figure 1.11. When scrolling, it is possible to move forward and backward through roughly a full weeks worth of data.

Description	Modbus Registers	Usage Notes For Read Only Registers
PSI Historical Log Index	040043	PSI Historical Log Index Value For Record Being Pointed To
PSI Historical Log Pressure	040044	PSI Historical Log PSI That Occurred 0-300 PSI
PSI Historical Log Month	040045	PSI Historical Log Month PSI Occured 1-12
PSI Historical Log Day	040046	PSI Historical Log Day PSI Occured 1-31
PSI Historical Log Year	040047	PSI Historical Log Year PSI Occurred 00-99
PSI Historical Log Hours	040048	PSI Historical Log Hour PSI Occurred 1-24
PSI Historical Log Minutes	040049	PSI Historical Log Minute PSI Occurred 0-59
PSI Historical Log Seconds	040050	PSI Historical Log Second PSI Occurred 0-59

Figure 1.11

Miscellaneous Floating Point Readings:

Battery amperage and voltage along with engine run hours and system pressure can all be read from the controller Real or Floating Point registers. These are Modbus registers 40186 through 40196. These registers will be double word and a separate poll definition must be used. No more than 50 registers can be pulled at a time. All available floating point registers are shown in Figure 1.12 and do not require scaling.

Description	Modbus Registers	Usage Notes For Read Only Registers
Battery 1 Volts Reading	040186	Battery 1 Volts Floating Point Value
Battery 2 Volts Reading	040188	Battery 2 Volts Floating Point Value
Battery 1 Amps Reading	040190	Battery 1 Amps Floating Point Value
Battery 2 Amps Reading	040192	Battery 2 Amps Floating Point Value
Engine Run Hours	040194	Engine Run Hours Floationg Point Value
Most Current PSI Pressure	040196	Most Current Pressure 0-300 PSI Floating Point Value
